

1 Overview

STC8H series of microcontrollers do not require an external crystal oscillator and external reset circuit. They are 8051 microcontrollers with the properties of strong anti-interference/ultra low price/high speed/low power consumption. Under the same operating frequency, STC8H series of microcontrollers are about 12 times faster (11.2 ~ 13.2 times) than traditional 8051. To execute all 111 instructions in sequence, the STC8H series microcontroller only needs 147 clocks, while the traditional 8051 requires 1944 clocks. STC8H series of microcontrollers are single clock/machine cycle (1T) microcontrollers produced by STC. They are new generation 8051 microcontrollers with wide voltage/high speed / high reliability / low power consumption / strong antistatic / strong anti-interference, and is super encrypted. The instruction codes are fully compatible with traditional 8051.

High precision of $\pm 0.3\%$ @+25℃ RC clock is integrated in MCU with -1.38% to $+1.42\%$ temperature drift under the temperature range of -40°C to $+85^{\circ}\text{C}$, and 0.88% to $+1.05\%$ temperature drift under temperature range from -20°C to $+65^{\circ}\text{C}$. The frequency of RC clock can be set from 4MHz to 35MHz when programming a MCU using ISP. **Note: The maximum frequency must be controlled below 35MHz when the temperature range is -40°C to $+85^{\circ}\text{C}$.** Moreover, high reliable reset circuit is integrated in MCU with 4 levels optional reset threshold voltages, which can be selected when user programming using ISP. So, external expensive crystal and the external reset circuit can be eliminated completely.

There are three optional clock sources inside the MCU, internal high precision IRC which can be adjusted appropriately, internal 32KHz low speed IRC, external 4MHz~33MHz oscillator or external clock signal. The clock source can be freely chosen in user codes. After the clock source is selected, it may be 8-bit divided and then be supplied to the CPU and the peripherals, such as timers, UARTs, SPI, and so on.

Two low power modes are provided in MCU, the IDLE mode and the STOP mode. In IDLE mode, MCU stops clocking CPU, CPU stops executing instructions without clock, while all peripherals are still working. At this moment, the power consumption is about 1.0mA at 6MHz working frequency. The STOP mode is the power off or power-down mode. At this moment, the main clock stops, CPU and all peripherals stop working, and the power consumption can be reduced to about 0.6uA when VCC is 5.0V, 0.4uA when VCC is 3.3V.

The Power-down mode can be woke-up by one of the following interrupts: INT0(P3.2), INT1(P3.3), INT2(P3.6), INT3(P3.7), INT4(P3.0), T0(P3.4), T1(P3.5), T2(P1.2), T3(P0.4), T4(P0.6), RXD(P3.0/P3.6/P1.6/P4.3), RXD2(P1.0/P4.6), RXD3(P0.0/P5.0), RXD4(P0.2/P5.2), I2C_SDA(P1.4/P2.4/P3.3), Comparator, LVD, Power-down wake-up timer.

Rich digital peripherals and analog peripherals are provided in MCU, including UARTs, timers, enhanced PWMs and I2C, SPI, USB, ultra-high speed ADC and comparator, which can meet the requirements of users when designing a product.

The enhanced dual data pointers are integrated in the STC8H series of microcontrollers. Using user codes, the function of automatic increasing or decreasing of data pointer and automatic switching of two sets of data pointers can be realized.

The download steps using ISP and notes are the same as the circumstances in 2.1.2.

When the user uses hardware USB to download code to STC8H8K64U series through ISP, the internal IRC frequency cannot be adjusted, but the user can choose 16 internal preset frequencies (respectively 5.5296M, 6M, 11.0592M, 12M, 18.432M, 20M, 22.1184m, 24M, 27M, 30M, 33.1776m, 35M, 36.864m, 40M, 44.2368m and 48M). The user can only select one of the frequencies from the drop-down list, and cannot manually enter other frequencies. (If you use serial port to download, you can input any frequency between 4M and 48M).

3 Package Dimensions

3.1 TSSOP20 Package mechanical data

3.2 LQFP32 Package mechanical data (9mm*9mm)

3.3 LQFP48 Package mechanical data (9mm*9mm)

3.4 QFN48 Package mechanical data (6mm*6mm)

The back metal sheet (substrate) of STC's existing DFN8 packaged chip is not grounded inside the chip. It can be grounded or ungrounded on the user's PCB board, which will not affect the performance of the chip.

3.5 LQFP64S Package mechanical data (12mm*12mm)

3.6 QFN64 Package mechanical data (8mm*8mm)

The back metal sheet (substrate) of STC's existing DFN8 packaged chip is not grounded inside the chip. It can be grounded or ungrounded on the user's PCB board, which will not affect the performance of the chip.
